Issue 37 - December 2019  
Special issue in honor of Uli Sauerland

## Contents

1.	Andreea C. Nicolae, Patrick D. Elliott, and Yasutada Sudo	
	<i>Introduction</i> .....	1
2.	Dorothy Ahn	
	<i>ASL IX to locus as a modifier</i> .....	2
3.	Artemis Alexiadou	
	<i>Decomposing scalar approximatives in Greek</i> .....	4
4.	Anna Alsop, Lucas Champollion, and Ioana Grosu	
	<i>A problem for Fox's (2007) account of free choice disjunction</i> .....	7
5.	Anton Benz and Nicole Gotzner	
	<i>Quantifier irgendein and local implicature</i> .....	10
6.	Jonathan David Bobaljik and Susi Wurmbrand	
	<i>Fake indexicals, binding, and the PCC</i> .....	13
7.	Brian Buccola and Emmanuel Chemla	
	<i>Alternatives of disjunctions: when a disjunct contains the antecedent of a pronoun</i> ....	16
8.	Luka Crnić and Brian Buccola	
	<i>Scoping NPIs out of DPs</i> .....	19
9.	Chris Cummins	
	<i>Some contexts requiring precise number meanings</i> .....	22
10.	Patrick D. Elliott and Paul Marty	
	<i>Exactly one theory of multiplicity inferences</i> .....	24

11.	Anamaria Fălăuș and Andreea C. Nicolae	
	<i>Two coordinating particles are better than one: free choice items in Romanian</i> . . . . .	27
12.	Danny Fox	
	<i>Individual concepts and narrow scope illusions</i> . . . . .	30
13.	Danny Fox	
	<i>Degree concepts and narrow scope illusions</i> . . . . .	33
14.	Nicole Gotzner	
	<i>Disjunction, conjunction, and exhaustivity</i> . . . . .	35
15.	Martin Hackl	
	<i>On Haddock's puzzle and the role of presupposition in reference resolution</i> . . . . .	37
16.	Andreas Haida	
	<i>Symmetry, density, and formal alternatives</i> . . . . .	40
17.	Nina Haslinger and Viola Schmitt	
	<i>Strengthened disjunction or non-classical conjunction?</i> . . . . .	43
18.	Fabian Heck and Anke Himmelreich	
	<i>Two observations about reconstruction</i> . . . . .	46
19.	Aron Hirsch	
	<i>Modal adverbs and constraints on type-flexibility</i> . . . . .	49
20.	Natalia Ivlieva and Alexander Podobryaev	
	<i>On variable agreement and scope reconstruction in Russian</i> . . . . .	52
21.	Hadil Karawani

# Decomposing scalar approximatives in Greek

Artemis Alexiadou · Leibniz-Zentrum Allgemeine Sprachwissenschaft

DOI: <http://dx.doi.org/10.7358/snip-2019-037-alex>

Greek has several *less precise scalar approximator* constructions (see Sauerland and Stateva 2007 for the term). Focusing on (1) and (2), I argue that the meaning of these constructions is built in the syntax. (1) and (2) are found in informal registers and involve determiners otherwise used as negative polarity items (Stavrou and Terzi 2008; Giannakidou 2012) (*kan*-Ds). *Kan*-Ds are not licensed by negation in these contexts (3). In (1), *ka-mia* combines with singular feminine nouns derived from numerals ending in *-aria/-osti* that are followed by NP<sub>Plural</sub>. In (2), singular *kan*-Ds combine with expressions of time or amount with which they agree in gender, yielding the interpretation of ‘around one’. *Kan* is not obligatory in (1).

- (1) Agorasa ka-mia ikos-aria/ ekato-sti vivlia  
bought.1SG KAN-one.FEM twenty-FEM/ hundred-FEM books  
‘I bought approximately 20/100 books.’
- (2) Thelo kan-ena mina/ ka-mia ora/ kan-ena kilo  
want.1SG KAN-one.MASC month.MASC/ KAN-one.FEM hour.FEM/ KAN-one.NEUT kilo.NEUT  
mila  
apples  
‘I need about a month/about an hour/about one kilo of apples.’
- (3) \* (Den) ida ka-mia gineka  
(neg) saw.1SG KAN-one.FEM woman  
‘I didn’t see any woman.’

Stavrou and Terzi (2008) analyze the numerical nouns in (1) as classifiers. I propose instead that such nouns are derived syntactically, as in (4).

- (4) [Quantity<sub>1P</sub> ka-mia [Q] [Div<sub>1P</sub> [<sub>nP1</sub> aria ] [Quantity<sub>2P</sub> eikos- [Div<sub>2P</sub> Number [<sub>nP2</sub> vivli-a ]]]]]

*-aria/-osti* realize a fixed gender/number  $n_1$  (Kramer 2015), which has quantity semantics, following Kayne (2010).  $n_1$  takes a Quantity<sub>2P</sub> as its complement. Numerals in Quantity<sub>2</sub> (Borer 2005) incorporate into *-aria/-osti*. Numerals obligatorily trigger plural on Greek nouns, hence ‘books’ bears plural (number in Div appearing on  $n$  due to Div- $n$  fusion in Greek).

I furthermore propose that *kan*-Ds are complex: they contain *ka(n)*, which combines with forms of the numeral ‘one’, cf. Martí (2015) on Spanish *alg-un*. According to Barouni (2018), *ka(n)* on its own is a minimizer and marks its associate as the endpoint of a scale. Numeral ‘one’ is in Quantity<sub>1P</sub>, (Borer 2005), agreeing in gender with  $n_1$ , and *ka(n)* is a Q modifier attaching to the numeral. In (1), the scale is determined by the approximate interpretation of round numerals (Krifka 2007). Note that no D head is contained in the lower extended projection, hence the numerical noun does not have independent reference.

Support for this analysis comes from the observation that the numerical noun can be modified by adjectives (5), and that only nouns that can independently co-occur with numerals are licit (6).

(5) Diavasa ka-mia dekaria kenuria vivlia  
 read.1SG KAN-one ten new books  
 ‘I read approximately ten new books.’

(6) a. \*deka arheresies  
 ten caucus.PL  
 ‘ten caucuses’  
 b. \*ka-mia dekaria arheresies  
 KAN-one ten caucus.PL  
 ‘about ten caucuses’

As Stavrou and Terzi (2008) note, in (1) the verb may agree with either the numerical noun as singular or the  $n_2$  as plural (7). Nevertheless, the *kan*-D always agrees with the numerical noun and not  $n_2$ , and the numerical noun surfaces with nominal/accusative case, depending on its grammatical function. This suggests that *Agree* can either see the highest Q or bypass it and see the head closest to T (cf. Klockmann 2017).

(7) Mia dekaria atoma espefsan/espefse  
 one ten persons came.3PL/came.1SG  
 ‘About ten people came.’

I propose a version of (4) is proposed for (2). *Ka(n)* is required here as Greek ‘one’ hasn’t yet fully grammaticalized to an approximative marker (cf. Plank 2002 on Bavarian). Temporal/amount nouns, having fixed gender/number, also realize a fused  $n_1$ /Div<sub>1</sub>; amount Ns may take a Div<sub>2</sub>P as their complement; ‘one’ in Quantity<sub>1</sub> determines the endpoint of the scale.
